1. INTRODUCTION

1.1 Textile Sector of Pakistan

Pakistan is amongst the leading producers of cotton in the world. To make full use of its abundant resources, the development of Textile Industry has been a priority area towards industrialization and export growth. Textile Industry is the major economic sector of Pakistan and for quite some time to come it will continue to be the main driving force in the industrial and agriculture area.

1.2 Textile contribution to Exports1

Pakistan's textile industry ranks amongst the top in the world. Pakistan is world's fourth largest producer of cotton and the third largest consumer of the same. Cotton based textiles contribute over $60\%^{1}$ to the total exports which amounts to around 5.2 billion US dollars. In Asia, Pakistan is the 8th largest exporter of textile products. The industry contributes around 46% to the total output produced in the country. The availability of cheap labor and basic raw cotton as raw material for textile industry has played the principal role in the growth of the Cotton

1.3 Established Capacity²

The textile industry of Pakistan has a total established spinning capacity of 1550 million kgs of yarn, weaving capacity of 4368 million square meters of fabric and finishing capacity of 4000 million square meters. The industry has a production capacity of 670 million units of garments, 400 million units of knitwear and 53 million kgs of towels.

The industry has a total of 1221 units engaged in ginning and 442 units engaged in spinning. There are around 124 large units that undertake weaving and 425 small units. There are around 20600 power looms in operation in the industry. The industry also houses around 10 large finishing units and 625 small units. Pakistan's textile industry has about 50 large and 2500 small garment manufacturing units. Moreover, it also houses around 600 knitwear-producing units and 400 towel-producing units.

1.4 Contribution to GDP and employment²

The contribution of this industry to the total GDP is 8.5%. It provides employment to 38% of the work force in the country, which amounts to a figure of 15 million. However, the proportion of skilled labor is very less as compared to that of unskilled labor.

S M E D A

1.5 Weaving Sector in Pakistan

Weaving sector is one of the most important textile sub-sectors. The exports of woven fabrics and other woven made ups comprise a major portion of textile exports from Pakistan.

Out of total world fabric trade of \$18 billion, Pakistan's share was about \$1.906⁴ billion in the year 2006-2007, which highlights the key position of Pakistan in the world textile trade. Other than direct fabric exports, Pakistan has also emerged as a leading exporter of woven made-ups with a value of more than \$1.922⁴ billion in the year 2006-2007.

1.6 Project Brief

This is a project of fabric weaving unit and is based on Auto Loom technology. The fabric quality produced on these looms is meant both for the local industry and for export purpose. This export can either be in the form of fabric or in the form of woven made-ups and hence will contribute in the earning of foreign exchange for the country.

The unit size as of 72 looms proves to be the best possible economically viable unit size as of this number of looms utilizes manpower most optimally. Therefore, a generic feasibility study has been prepared while taking 72 number of looms as a base figure. The complete project details of 72 wider width Auto Looms have been covered in this section.

⁴ Source: Federal Bureau of Statistics (FBS)

³ Economic Survey 2006-07

1.7 Opportunity Rationale

The world demand for textiles is rising at around 2.5%⁵, due to which there is a greater opportunity for rise in exports from Pakistan. Weaving sector is comprised of two types of setups. One is the organized mill sector and the other is the unorganized non-mill sector. The non-mill-weaving sector, which is also called the Auto/Power Loom sector, supplies the majority of the fabric in the country.

Pakistan exported about 2.211⁶ billion square meters of fabric in the year Jul – Jun 2006-07. Estimated share of Power Looms in fabric exports is about 60%, with a value of more than \$500 million. Besides exporting, this sector also supplies fabric to manufacturers and exporters of the garments/made-ups in the domestic market.

The Power Loom sector employ's low level of technology and hence has low productivity and quality. The fabric manufactured on Power Looms is of inferior quality and is unable to fetch high unit value in the international markets. Also, due to technical limitations (i.e. shorter width), it does not produce the specifications, which are required in the international market.

The diversification of the garments/made-ups sector is not possible without modernization of the non-mill-weaving sector. Installation of the modern looms is therefore, necessary to upgrade the product quality, reduce production cost, strengthen the competitiveness and stabilize the operations so as to be more profitable.

1.7.1 High Growth Rate in the Export of Made-Ups

Export of made-ups from Pakistan, basically comprises of bed sheets and pillow covers. The basic material used in these bed sheets/pillow covers is printed fabric and the primary source of supply of this fabric in raw form is the Auto Loom sector.

Table 1-1 Made-ups (Incl. Bed Wear) Exports from Pakistan (Value in Million \$)⁶

| 2001-02 | 2002-03 | 2003-04 | 2004-05 | 2005-06 | 2006-07 |
|---------|---------|---------|---------|---------|---------|
| 1,269 | 1,688 | 1,799 | 1,915 | 2,455 | 2,467 |

Above table shows the export value of made-ups over the period 2006-07. A fruitful growth rate can be seen in the export of made-ups. The average growth rate during this period is approximately 15% per year.

As the exports of textile made-ups directly relate to the fabric production of Auto Loom sector, we can forecast that high growth rate in the exports is a favorable market factor for this sector.

⁵ Source: Textile Information and Web Guide, <u>www.textileinfo.net</u>

⁶ Source: Export from Pakistan by TDAP (Trade Development Authority of Pakistan)

Through technology up-gradation of this sector, the quality of fabric will improve and it will allow for production of wider width fabric for made-ups in the export markets.

1.7.2 Quotas & Import Tariffs

According to WTO agreement, quotas are being phased out and import tariffs are being reduced in the major importing markets of textile items from Pakistan. By the year 2005, all quota restrictions were eliminated and tariffs were reduced to minimum limits.

The European Union has already increased the quota limits for Pakistan and reduced the import duties on textile products from Pakistan. This has shown a very positive impact on the textile exports of Pakistan, especially the textile fabrics and made-ups. This changing scenario of world trade is going to have a very positive impact on the exports of textile products from Pakistan, especially fabrics and made-ups.

Keeping in view the export growth rates of made-ups from Pakistan during the last few years, post quota years will be having a multiplier effect on the made-ups export from Pakistan. The Auto Loom sector is the major source of raw material of grey fabric to be converted into printed fabric and ultimately into bed sheets and pillow covers. It is expected that demand will increase for this sector in the coming days. If this sector is equipped with better technology and produce better quality products, it will certainly fetch better unit values and more value and quantity of exports.

1.7.3 Raw Material Mechanics

From mid 1990's and onward, the spinning industry of Pakistan has been facing hard times, mainly because of bad cotton crops during this time period. This raised the yarn prices in the local market and adversely affected the performance of the main consumer of that raw material i.e. Auto Loom sector.

However, since the year 2000 onward, the spinning industry in the country has got a positive shift. Most of the closed spinning units are functional again and heavy investment has been made for Balancing, Modernization & Rehabilitation (BMR) of the spinning industry during the year 2000-2001.

Because of this, it is forecasted that now the supply of yarn in the local market will be stable and the variations in the yarn prices will be limited.

1.8 Proposed Capacity

The proposed project size is 72 new wider width Auto Looms

1.9 Total Project Cost

The total cost of the project is about Rs. 17.921 million

2. INDUSTRY STRUCTURE

2.1 Current Structure of industry

Weaving sector of Pakistan is comprised of both the organized and the unorganized sectors. The organized sector⁷ has shuttle-less and Air-Jet looms. Shuttle-less looms are either the Projectile or Rapier type. The un-organized sector called "Power Loom" sector has about 225,000 looms. Major known Power Loom clusters are in Faisalabad, Gujranwala, Gujrat, Multan, Karachi, Kasur and Jhang. However, Faisalabad is the biggest cluster in Pakistan, having about 125,000 Power Looms.

Power Loom sector in Pakistan is highly fragmented and is based on cottage/small scale and unorganized manufacturing clusters. Out of 225,000 total looms in this sector, 90% consists of basic Power Looms units and 10% are equipped with an auto cop changer, which are called Auto Looms.

There are a substantial number of units in this sector, which have 50 to 100 looms in a single premise as one unit.

Historically, Power Looms industry started on a cottage scale in the country. Even in present days, major chunk of the industry is based on small home-based units. Mostly, the owners and their family members themselves are managing these units. However, eventually with the increase in the number of looms, these families have been multiplying the number of their units and looms. Under the existing set-up, same family can own a multiple of units but they keep the size of one unit as low as maximum of eight looms per unit. In this way, they try to get the benefit of tax and avoid formal documentation that may be required by different Government agencies.

There are two representative Associations of this sector. "Pakistan Small Units Power Looms Association" represents those units having up to eight looms and "All Pakistan Cotton Power Looms Association" represents those units having more than eight looms. Different clusters have their independent Associations as well.

Since the last 5 to 10 years, the numbers of independent loom units with 24 looms (or above) have been increasing. These units are comparatively more structured and have formal set-ups as compared to cottage units. It has been observed that a substantial number of units with 100 looms or above do exist in the main clusters as well.

It has also been observed that traditionally, there is no concept of formal bank financing in this sector to establish new projects or to expand an existing one. Most of the projects are based on 100% self-financing. Generally, most of the people own the land and building themselves and there are very few units, which are on rental premises.

There are two types of systems on which Auto Looms industry is operating. The units, which are comparatively structured and have a high number of looms, have good financial strength. These units procure their raw material with their own

⁷ According to an estimate by Textile Commissioner's Organization, there are 10,200 Projectile, 1,307 Rapier, 600 Water Jet and 4,033 Air Jet looms in the organized mill sector.

investment, go for their own production and earn good margins on the sale of fabric in the local market or by exporting it in the form of fabric or made-ups.

The other system operates on "conversion" basis. These units don't have the financial strength to procure raw material for themselves. The customers provide the main raw material that is yarn and these manufacturing units just take the conversion charges for converting yarn into fabric. In this case, the profit margins are limited.

2.2 Existing Technology & Industry Trends

The technology of Power Loom dates back to late eighteenth century. Most of the Power Looms installed are of shorter width (less than 76"), 10 to 15 years old (or even more) in poor physical condition.

The quality of cloth woven on these looms carries many inherent fabric faults that are normally not acceptable by quality conscious customers, especially in the export markets. The present production of existing looms and quality of fabric is catering mostly to the lower end of the export markets that is low quality, low price and hence is unable to fetch good unit prices.

Current split of the Power Looms industry is as follows:

- a). 60% Power Looms are more than 10 years old with widths 44" 72"
- **b).** 20% Power Looms are 5 to 10 years old with widths 72" 120"
- c). 20% Power Looms are 1 to 5 years old with widths 72" 120"

For the past decade or so, the trend is shifting from shorter/medium width Power Looms (47" - 76") to wider width Auto and Shuttle-less looms (105" - 160"). The fabric manufactured on the shorter width looms mostly caters to the local market demand while the wider width looms take care of the quality conscious export market of made-ups. Subsequently, the yarn requirement for these two looms also differs owing to the difference in the expected quality of output. The quality of yarn that is used for fabric production for export purposes is better so that the fabric has fewer faults.

Derived by the demand for export markets, awareness is already increasing to replace the existing shorter width power looms with wider width auto or shuttle-less looms.

3. MACHINERY

3.1 Machinery Details

Following is the list of machinery and other equipment, required for a new unit of 72 wider width Auto Looms. It is recommended to install a humidifier plant in the premises because it keeps the humidity level in the manufacturing area high, which helps in reducing breakage of yarn. Folding machine helps in folding the cloth more efficiently.

Cost/Machine (Rs.) **Machine Description** No. **Total Cost** (**Rs.**) Auto Loom (108"/112" Width) 72 140,000 10,080,000 **Humidifier Plant** Winder Folding Machine Electric Wire Spare bean Clot roles Cone winder 40.000 / loom 2,880,000 A/C plant Healed frame Dropper Reed Healed wire Electric motor (720 rpm – 1 HP) Transformer (100 KW) 1 350,000 350,000 **Total** 13,310,000

Table 3-1 Machinery & Equipment List

3.2 Machinery Suppliers

There are a number of manufacturers engaged in loom manufacturing in and around Faisalabad. They consist of two types of manufacturers, the established ones in the formal sector and temporary assemblers, who crop up whenever there is demand.

4. MANPOWER REQUIREMENTS

4.1 Human Resource Requirements

For an Auto Loom unit of 72 looms, following manpower is required:

Figure 4-1 Human Resource Requirements

| Title | Requirement | Salary/Month | Salary/Annum |
|--------------------------|-------------|--------------|--------------|
| Managing Director | 1 | 40,000 | 480,000 |
| GM Operations | 1 | 30,000 | 360,000 |
